

第二讲 矩阵及其运算

1. 矩阵的定义;
2. 矩阵的运算; (重点)
3. 伴随矩阵; (重点)
4. 逆矩阵; (重点, 难点)
5. 分块矩阵.

2.1 矩阵的定义

1. 定义: 称数表 $\begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix}_{m \times n} \triangleq A_{m \times n} \triangleq (a_{ij})_{m \times n}$ 为 $m \times n$ 矩阵.

如 $A_{2 \times 2} = \begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$, $A_{2 \times 4} = \begin{pmatrix} -1 & 0 & 1 & 3 \\ 2 & 3 & 5 & -2 \end{pmatrix}$

注: ① 行列式与矩阵的区别: 行列式=数; 矩阵=表.

② 行矩阵: 只有一行的矩阵, $A_{1 \times n} = (a_{11} \ a_{12} \ \cdots \ a_{1n})$
(行向量)

③ 列矩阵: 只有一列的矩阵, $A_{n \times 1} = \begin{pmatrix} a_{11} \\ a_{21} \\ \vdots \\ a_{n1} \end{pmatrix}$
(列向量)

2. 同型矩阵:

① 若两个矩阵的行数相等, 列数也相等, 则称它们为同型矩阵.

如 $A_{2 \times 3} = \begin{pmatrix} a_1 & a_2 & a_3 \\ a_4 & a_5 & a_6 \end{pmatrix}$ 与 $B_{2 \times 3} = \begin{pmatrix} b_1 & b_2 & b_3 \\ b_4 & b_5 & b_6 \end{pmatrix}$ 同型阵

② 若两个同型矩阵 $A_{m \times n} = (a_{ij})_{m \times n}$, $B_{m \times n} = (b_{ij})_{m \times n}$ 满足 $a_{ij} = b_{ij}, \forall i, j$
则称 A 与 B 相等, $A = B$.

3. 几类特殊的矩阵.

① 零矩阵: 元素都是 0 的矩阵.

$O = \begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$

② 方阵：行数与列数都等于 n 的矩阵称为 n 阶方阵或 n 阶矩阵。

如： $A = \begin{pmatrix} 1 & 2 \\ 3 & 5 \end{pmatrix}_{2 \times 2}$ $B_{3 \times 3} = \begin{pmatrix} 1 & 0 & 3 \\ 0 & -1 & 1 \\ 5 & 2 & 4 \end{pmatrix}$

③ 单位矩阵：主对角元素全为 1，其余元素均为 0 的方阵，称为 n 阶单位矩阵，记为 $E_{n \times n}$ 或 $I_{n \times n}$ 。

如： $E_{3 \times 3} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$ 三阶单位阵

④ 数量矩阵：主对角元素全为 k ，其余元素均为 0 的方阵，称为 n 阶数量矩阵（或纯量阵），记为 kE 或 kI 。

如： $A = \begin{pmatrix} k & 0 & 0 \\ 0 & k & 0 \\ 0 & 0 & k \end{pmatrix} \equiv kE$ 。

⑤ 对角矩阵：非主对角元素均为 0 的 n 阶矩阵，称为对角阵，记为 Λ 。

如： $\Lambda = \begin{pmatrix} \lambda_1 & 0 & 0 \\ 0 & \lambda_2 & 0 \\ 0 & 0 & \lambda_3 \end{pmatrix} \equiv \text{diag}(\lambda_1, \lambda_2, \lambda_3)$

例. 设变量 x_1, x_2, x_3 与变量 y_1, y_2 之间的关系式：

$$\begin{cases} y_1 = a_{11}x_1 + a_{12}x_2 + a_{13}x_3 \\ y_2 = a_{21}x_1 + a_{22}x_2 + a_{23}x_3 \end{cases}$$
 表示一个从变量 x_1, x_2, x_3 到变量 y_1, y_2 的线性变换

其系数矩阵 $A = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \end{pmatrix}$ 。

特别地， $\begin{cases} y_1 = x_1 + 2x_2 - x_3 \\ y_2 = x_2 + ax_3 \end{cases}$ 的系数矩阵 $A = \begin{pmatrix} 1 & 2 & -1 \\ 0 & 1 & a \end{pmatrix}$

2.2 矩阵的运算 (一): 加法、乘法

1. 矩阵的加法

设 $A_{m \times n} = (a_{ij})_{m \times n}$, $B_{m \times n} = (b_{ij})_{m \times n}$, 则 A 与 B 的和为:

$$A+B = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix}_{m \times n} + \begin{pmatrix} b_{11} & b_{12} & \cdots & b_{1n} \\ b_{21} & b_{22} & \cdots & b_{2n} \\ \vdots & \vdots & & \vdots \\ b_{m1} & b_{m2} & \cdots & b_{mn} \end{pmatrix}_{m \times n} = \begin{pmatrix} a_{11}+b_{11} & a_{12}+b_{12} & \cdots & a_{1n}+b_{1n} \\ a_{21}+b_{21} & a_{22}+b_{22} & \cdots & a_{2n}+b_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1}+b_{m1} & a_{m2}+b_{m2} & \cdots & a_{mn}+b_{mn} \end{pmatrix}$$

如: $A = \begin{pmatrix} 1 & -1 \\ 2 & 3 \end{pmatrix}$, $B = \begin{pmatrix} 3 & 4 \\ 0 & 2 \end{pmatrix} \Rightarrow$ 则 $A+B = \begin{pmatrix} 1+3 & -1+4 \\ 2+0 & 3+2 \end{pmatrix} = \begin{pmatrix} 4 & 3 \\ 2 & 5 \end{pmatrix}$

注: 两个矩阵 A 与 B 能够相加的前提: A 与 B 为同型矩阵.

2. 矩阵的数量乘法 (简称数乘)

$$kA_{m \times n} = k \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix}_{m \times n} = \begin{pmatrix} ka_{11} & ka_{12} & \cdots & ka_{1n} \\ ka_{21} & ka_{22} & \cdots & ka_{2n} \\ \vdots & \vdots & & \vdots \\ ka_{m1} & ka_{m2} & \cdots & ka_{mn} \end{pmatrix}$$

如: $2A = 2 \cdot \begin{pmatrix} a_1 & a_2 & a_3 \\ a_4 & a_5 & a_6 \end{pmatrix} = \begin{pmatrix} 2a_1 & 2a_2 & 2a_3 \\ 2a_4 & 2a_5 & 2a_6 \end{pmatrix}$ (矩阵的所有元素均乘2)

区别于: $2 \cdot |A_{2 \times 2}| = 2 \cdot \begin{vmatrix} a_1 & a_2 \\ a_3 & a_4 \end{vmatrix} = \begin{vmatrix} 2a_1 & 2a_2 \\ a_3 & a_4 \end{vmatrix}$ (行列式的某行或列元素均乘2)

注: ① $kA = A \cdot k$; ② $(k_1 + k_2)A = k_1A + k_2A$

③ $k(A+B) = kA + kB$. ④ 矩阵相加与数乘, 统称线性运算

3. 矩阵的乘法

设有一个从变量 x_1, x_2 到变量 y_1, y_2 的线性变换:
$$\begin{cases} y_1 = a_{11}x_1 + a_{12}x_2 \\ y_2 = a_{21}x_1 + a_{22}x_2 \end{cases} \quad (1)$$

另有一个从变量 t_1, t_2 到变量 x_1, x_2 的线性变换:
$$\begin{cases} x_1 = b_{11}t_1 + b_{12}t_2 \\ x_2 = b_{21}t_1 + b_{22}t_2 \end{cases} \quad (2)$$

求从 t_1, t_2 到 y_1, y_2 的线性变换: 只须把 (2) 代入 (1) 即得:

$$\begin{cases} y_1 = (a_{11}b_{11} + a_{12}b_{21})t_1 + (a_{11}b_{12} + a_{12}b_{22})t_2 \\ y_2 = (a_{21}b_{11} + a_{22}b_{21})t_1 + (a_{21}b_{12} + a_{22}b_{22})t_2 \end{cases} \quad (3)$$

$\Rightarrow$ 称线性变换 (1) 与 (2) 的乘积为线性变换 (3)

线性变换 $\begin{cases} y_1 = a_{11}x_1 + a_{12}x_2 \\ y_2 = a_{21}x_1 + a_{22}x_2 \end{cases} \quad (1)$ 对应矩阵: $A = \begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix}$

$\begin{cases} x_1 = b_{11}t_1 + b_{12}t_2 \\ x_2 = b_{21}t_1 + b_{22}t_2 \end{cases} \quad (2)$ 对应矩阵: $B = \begin{pmatrix} b_{11} & b_{12} \\ b_{21} & b_{22} \end{pmatrix}$

线性变换 (1) 与 (2) 的乘积为线性变换 (3)

$\begin{cases} y_1 = (a_{11}b_{11} + a_{12}b_{21})t_1 + (a_{11}b_{12} + a_{12}b_{22})t_2 \\ y_2 = (a_{21}b_{11} + a_{22}b_{21})t_1 + (a_{21}b_{12} + a_{22}b_{22})t_2 \end{cases} \quad (3)$

对应矩阵: $C = \begin{pmatrix} a_{11}b_{11} + a_{12}b_{21} & a_{11}b_{12} + a_{12}b_{22} \\ a_{21}b_{11} + a_{22}b_{21} & a_{21}b_{12} + a_{22}b_{22} \end{pmatrix}$

⇒ 把矩阵 A 与 B 的乘积记作 C. $C = AB$

定义: 设 $A_{m \times n} = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix}_{m \times n}$, $B_{n \times s} = \begin{pmatrix} b_{11} & \cdots & b_{1j} & \cdots & b_{1s} \\ b_{21} & \cdots & b_{2j} & \cdots & b_{2s} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ b_{n1} & \cdots & b_{nj} & \cdots & b_{ns} \end{pmatrix}_{n \times s}$

⇒ 则 $A_{m \times n} \cdot B_{n \times s} \triangleq C_{m \times s} \triangleq (C_{ij})_{m \times s}$

其中, $C_{ij} = (a_{i1} \ a_{i2} \ \cdots \ a_{in}) \cdot \begin{pmatrix} b_{1j} \\ b_{2j} \\ \vdots \\ b_{nj} \end{pmatrix} = a_{i1}b_{1j} + a_{i2}b_{2j} + \cdots + a_{in}b_{nj}, \forall i, j$

例如: $A_{3 \times 2} = \begin{pmatrix} 1 & 2 \\ -1 & 0 \\ 0 & 1 \end{pmatrix}$, $B_{2 \times 2} = \begin{pmatrix} 1 & 0 \\ -1 & 2 \end{pmatrix}$

则 $A_{3 \times 2} \cdot B_{2 \times 2} = \begin{pmatrix} 1 & 2 \\ -1 & 0 \\ 0 & 1 \end{pmatrix}_{3 \times 2} \cdot \begin{pmatrix} 1 & 0 \\ -1 & 2 \end{pmatrix}_{2 \times 2} = \begin{pmatrix} 1 \times 1 + 2 \times (-1) & 1 \times 0 + 2 \times 2 \\ -1 \times 1 + 0 \times (-1) & -1 \times 0 + 0 \times 2 \\ 0 \times 1 + 1 \times (-1) & 0 \times 0 + 1 \times 2 \end{pmatrix}_{3 \times 2} = \begin{pmatrix} -1 & 4 \\ -1 & 0 \\ -1 & 2 \end{pmatrix}_{3 \times 2}$

$A_{m \times n} \cdot B_{n \times s} \triangleq C_{m \times s} \triangleq (C_{ij})_{m \times s}$

注: ① 关于矩阵相乘: “合法看内标”, “类型看外标”.

② 结合律: $(AB) \cdot C = A(BC)$; ③ 分配律: $A(B+C) = AB+AC$

④ 不满足交换律: $AB \neq BA$ 但是, $A \cdot E = E \cdot A$

例如 $AB = \begin{pmatrix} 1 & 2 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} -1 & 1 \\ 1 & 2 \end{pmatrix} = \begin{pmatrix} 1 & 5 \\ 1 & 2 \end{pmatrix}$, 但 $BA = \begin{pmatrix} -1 & 1 \\ 1 & 2 \end{pmatrix} \begin{pmatrix} 1 & 2 \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} -1 & -1 \\ 1 & 2 \end{pmatrix}$

⑤ 不满足消去律: 若 $AB=AC \nRightarrow B=C$

例如 $AB = \begin{pmatrix} 1 & 2 \\ 3 & 6 \end{pmatrix} \begin{pmatrix} 3 & 4 \\ -1 & 2 \end{pmatrix} = \begin{pmatrix} 1 & 8 \\ 3 & 24 \end{pmatrix}$

$AC = \begin{pmatrix} 1 & 2 \\ 3 & 6 \end{pmatrix} \begin{pmatrix} 1 & 2 \\ 0 & 3 \end{pmatrix} = \begin{pmatrix} 1 & 8 \\ 3 & 24 \end{pmatrix}$

$AB = AC$ 虽然 $AB=AC$, 但 $B \neq C$

例. 设列矩阵 $A_{m \times 1} = \begin{pmatrix} a_1 \\ a_2 \\ \vdots \\ a_n \end{pmatrix}$, 行矩阵 $B_{1 \times n} = (b_1 \ b_2 \ \dots \ b_n)$ (1) 求 AB , (2) 求 BA

解: (1) $A_{m \times 1} \cdot B_{1 \times n} = \begin{pmatrix} a_1 \\ a_2 \\ \vdots \\ a_n \end{pmatrix} (b_1 \ b_2 \ \dots \ b_n)_{1 \times n} = \begin{pmatrix} a_1 b_1 & a_1 b_2 & \dots & a_1 b_n \\ a_2 b_1 & a_2 b_2 & \dots & a_2 b_n \\ \vdots & \vdots & \ddots & \vdots \\ a_n b_1 & a_n b_2 & \dots & a_n b_n \end{pmatrix}$ (每行(或列)成比例)
"行列阵"

(逆向思维): $\begin{pmatrix} 2 & 1 & 3 \\ 4 & 2 & 6 \\ 6 & 3 & 9 \end{pmatrix}$ 因每行成比例且非0 $\begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix} (2 \ 1 \ 3)$; $\begin{pmatrix} 2 & 4 \\ 1 & 2 \end{pmatrix} = \begin{pmatrix} 2 \\ 1 \end{pmatrix} (1 \ 2)$

(2) $B_{1 \times n} \cdot A_{m \times 1} = (b_1 \ b_2 \ \dots \ b_n)_{1 \times n} \cdot \begin{pmatrix} a_1 \\ a_2 \\ \vdots \\ a_n \end{pmatrix}_{m \times 1} = a_1 b_1 + a_2 b_2 + \dots + a_n b_n = \text{迹}(AB)$ "行列阵"

例. 设 A, B 均为 n 阶方阵, 解释以下结论:

① $(A+B)^2 \neq A^2 + 2AB + B^2$; ② $A^2 - B^2 \neq (A-B)(A+B)$

③ $(AB)^2 \neq A^2 B^2$

解: ① 右边 $= (A+B)^2 = (A+B)(A+B) = A^2 + AB + BA + B^2 \neq A^2 + 2AB + B^2$

但 $(A+E)^2 = A^2 + 2A + E$

② 右边 $= (A-B)(A+B) = A^2 + AB - BA - B^2 \neq A^2 - B^2$

但 $A^2 - E^2 = (A-E)(A+E)$

③ 左边 $= (AB)^2 = AB \cdot AB \neq A \cdot AB \cdot B = A^2 B^2$

2.2 矩阵的运算（二）：转置、行列式

框框老师课堂

框框老师课堂

1. 矩阵的转置.

定义: 把 $A_{m \times n}$ 的行列互换得到的矩阵, 称为 A 的转置矩阵, 记为 A^T

如: $A = \begin{pmatrix} 1 & 2 & 0 \\ 3 & -1 & 1 \end{pmatrix}$, $A^T = \begin{pmatrix} 1 & 3 \\ 2 & -1 \\ 0 & 1 \end{pmatrix}$

注: ① $(A^T)^T = A$; ② $(A+B)^T = A^T + B^T$; ③ $(kA)^T = kA^T$; ④ $(AB)^T = B^T A^T$.

解释: ④ 例如: $(AB)^T = \left[\begin{pmatrix} 1 & 2 & 3 \\ 1 & 2 & 1 \end{pmatrix} \cdot \begin{pmatrix} 1 & -1 \\ 3 & -3 \\ 2 & 1 \end{pmatrix} \right]^T = \begin{pmatrix} 13 & -4 \\ -5 & 8 \end{pmatrix}^T = \begin{pmatrix} 13 & -5 \\ -4 & 8 \end{pmatrix}$

$B^T A^T = \begin{pmatrix} 1 & 3 & 2 \\ -1 & -3 & 1 \end{pmatrix} \begin{pmatrix} 1 & -1 \\ 2 & -2 \\ 3 & 1 \end{pmatrix} = \begin{pmatrix} 13 & -5 \\ -4 & 8 \end{pmatrix}$

$(ABC)^T = C^T B^T A^T$

2. 对称矩阵与反对称矩阵 (针对方阵)

框框老师课堂

框框老师课堂

若 A 为 n 阶方阵, 且 $A^T = A$, 即 $a_{ij} = a_{ji}$, $i, j = 1, 2, \dots, n \Rightarrow$ 称 A 为对称阵.

且 $A^T = -A$, 即 $a_{ij} = -a_{ji}$, $i, j = 1, 2, \dots, n \Rightarrow$ 称 A 为反对称阵.

例如: $A = \begin{pmatrix} 1 & 2 & 3 \\ 2 & -1 & 4 \\ 3 & 4 & 0 \end{pmatrix} \Rightarrow A^T = A$, 则 A 为对称阵.

(对称阵的特点: 它的元素以主对角线为轴上下相等)

若 $A = \begin{pmatrix} 1 & 2 & 3 \\ 2 & -1 & 4 \\ 3 & 4 & 0 \end{pmatrix}$, 能否认为 A 为反对称阵呢?

因 $A^T = \begin{pmatrix} 1 & 2 & 3 \\ 2 & -1 & 4 \\ 3 & 4 & 0 \end{pmatrix}$, $-A = \begin{pmatrix} -1 & -2 & -3 \\ -2 & 1 & -4 \\ -3 & -4 & 0 \end{pmatrix} \Rightarrow A^T \neq -A \Rightarrow A$ 不是反对称阵!

若 $A = \begin{pmatrix} 0 & 2 & 3 \\ 2 & 0 & 4 \\ 3 & 4 & 0 \end{pmatrix}$, 问 A 是否为反对称阵呢?

框框老师课堂

框框老师课堂

因 $A^T = \begin{pmatrix} 0 & 2 & 3 \\ 2 & 0 & 4 \\ 3 & 4 & 0 \end{pmatrix}$, $-A = \begin{pmatrix} 0 & -2 & -3 \\ -2 & 0 & -4 \\ -3 & -4 & 0 \end{pmatrix} \Rightarrow A^T = -A$, 则 A 为反对称阵

反对称阵的特点: 1° A 的主对角元素全为 0. (即 $a_{ii} = 0$, $i = 1, 2, \dots, n$)

2° A 的其它元素以主对角线为轴上下相反.

例. 设 A 为反对称阵, B 为对称阵, 试证: $AB-BA$ 为对称阵. 框框老师课堂

证明: 由 $A^T = -A$, $B^T = B$,

$$(AB-BA)^T = (AB)^T - (BA)^T$$

$$= B^T A^T - A^T B^T$$

$$= -BA + AB$$

$$= AB-BA$$

$\therefore AB-BA$ 为对称阵

例. 设列矩阵: $X = \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{pmatrix}$, E 为 n 阶单位阵, $H = E - 2XX^T$, 证明 H 为对称阵. 框框老师课堂

$$\text{证明: } H^T = (E - 2XX^T)^T = E^T - 2(XX^T)^T$$

$$= E - 2XX^T$$

$$= H$$

$\therefore H^T = H$, H 为对称阵

3. 方阵的行列式

(1) 设 n 阶方阵 $A_{n \times n} = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{pmatrix}$, 称 $|A_{n \times n}| = \begin{vmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{vmatrix}$ 为 A 的行列式. 框框老师课堂

(2) 性质: ① $|A^T| = |A|$; ② $|kA_{n \times n}| = k^n |A|$; ③ $|AB| = |A||B|$

解释: ③ $|AB| = |A||B|$ 设 $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$, $B = \begin{pmatrix} e & f \\ g & h \end{pmatrix}$, 构造 $\begin{vmatrix} a & b & 0 & 0 \\ c & d & 0 & 0 \\ -1 & 0 & e & f \\ 0 & -1 & g & h \end{vmatrix}$

1° 首先, 利用拉普拉斯公式, $\begin{vmatrix} a & b & 0 & 0 \\ c & d & 0 & 0 \\ -1 & 0 & e & f \\ 0 & -1 & g & h \end{vmatrix} = \begin{vmatrix} a & b \\ c & d \end{vmatrix} \cdot \begin{vmatrix} e & f \\ g & h \end{vmatrix} = |A| \cdot |B| = \text{右边}$

2° 另外, $\begin{vmatrix} a & b & 0 & 0 \\ c & d & 0 & 0 \\ -1 & 0 & e & f \\ 0 & -1 & g & h \end{vmatrix} \xrightarrow{C_3+eC_1} \begin{vmatrix} a & b & ae & bh \\ c & d & ce & dh \\ -1 & 0 & 0 & f \\ 0 & -1 & g & 0 \end{vmatrix} \xrightarrow{C_4+gC_2} \begin{vmatrix} a & b & ae+bg & bh+gh \\ c & d & ce+dg & dh+gh \\ -1 & 0 & 0 & f \\ 0 & -1 & 0 & 0 \end{vmatrix} \xrightarrow{C_3+gC_2} \begin{vmatrix} a & b & ae+bg & bh+gh \\ c & d & ce+dg & dh+gh \\ -1 & 0 & 0 & f \\ 0 & -1 & 0 & 0 \end{vmatrix} \xrightarrow{\text{拉普拉斯}} (-1) \cdot |AB| = |AB|$

例. 设 $A = \begin{pmatrix} x_1 & b_1 \\ x_2 & b_2 \end{pmatrix}$, $B = \begin{pmatrix} y_1 & b_1 \\ y_2 & b_2 \end{pmatrix}$, 且已知 $|A|=2$, $|B|=-7$, 求 $|A+B|$

错解: $|A+B| \neq |A| + |B|$

正解: ① 先求矩阵: $A+B = \begin{pmatrix} x_1 & b_1 \\ x_2 & b_2 \end{pmatrix} + \begin{pmatrix} y_1 & b_1 \\ y_2 & b_2 \end{pmatrix} = \begin{pmatrix} x_1+y_1 & 2b_1 \\ x_2+y_2 & 2b_2 \end{pmatrix}$

$$\begin{aligned} \text{② } |A+B| &= \begin{vmatrix} x_1+y_1 & 2b_1 \\ x_2+y_2 & 2b_2 \end{vmatrix} = 2 \begin{vmatrix} x_1+y_1 & b_1 \\ x_2+y_2 & b_2 \end{vmatrix} = 2 \left[\begin{vmatrix} x_1 & b_1 \\ x_2 & b_2 \end{vmatrix} + \begin{vmatrix} y_1 & b_1 \\ y_2 & b_2 \end{vmatrix} \right] \\ &= 2[|A| + |B|] \\ &= 2[2 + (-7)] \\ &= -10 \end{aligned}$$

2.3 伴随矩阵

(1) 定义: 设 $A_{3 \times 3} = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix}$, 称 $A^* = \begin{pmatrix} A_{11} & A_{21} & A_{31} \\ A_{12} & A_{22} & A_{32} \\ A_{13} & A_{23} & A_{33} \end{pmatrix}$ 为矩阵 A 的伴随矩阵

其中 A_{ij} 为 $|A|$ 中元素 a_{ij} 的代数余子式.

注: ① 若 $A_{2 \times 2} = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$, 则 $A^* = \begin{pmatrix} A_{11} & A_{21} \\ A_{12} & A_{22} \end{pmatrix} = \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$ = 阶伴随: "调主反副"

② A^* 的元素是 $|A|$ 的所有元素的代数余子式按列顺序构成.

$$A_{n \times n} = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{pmatrix}, \text{ 则 } A^* = \begin{pmatrix} A_{11} & A_{21} & \dots & A_{n1} \\ A_{12} & A_{22} & \dots & A_{n2} \\ \vdots & \vdots & \ddots & \vdots \\ A_{1n} & A_{2n} & \dots & A_{nn} \end{pmatrix}$$

(2) 基本性质: $AA^* = A^*A = |A| \cdot E$ 伴阵 A^* : 伴随矩阵

解释: $|A_{3 \times 3}| = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = \text{某行(或列)元素乘以相应代数余子式再求和}$
 $= a_{11}A_{11} + a_{12}A_{12} + a_{13}A_{13} = a_{21}A_{21} + a_{22}A_{22} + a_{23}A_{23}$

(注: 某行元素乘以其它行的代数余子式再求和 = 0, 如 $a_{11}A_{21} + a_{12}A_{22} + a_{13}A_{23} = 0$)

设 $A = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix}$, $A^* = \begin{pmatrix} A_{11} & A_{21} & A_{31} \\ A_{12} & A_{22} & A_{32} \\ A_{13} & A_{23} & A_{33} \end{pmatrix}$ $\begin{pmatrix} k & 0 & 0 \\ 0 & k & 0 \\ 0 & 0 & k \end{pmatrix} = k \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$

$\Rightarrow AA^* = \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix} \begin{pmatrix} A_{11} & A_{21} & A_{31} \\ A_{12} & A_{22} & A_{32} \\ A_{13} & A_{23} & A_{33} \end{pmatrix} = \begin{pmatrix} |A| & 0 & 0 \\ 0 & |A| & 0 \\ 0 & 0 & |A| \end{pmatrix} = |A| \cdot E$
 $A^*A = |A| \cdot E$
 $= |A| \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} = |A| \cdot E$

例. 设 $A = \begin{pmatrix} 2 & 1 & 0 \\ 1 & 2 & 0 \\ 0 & 0 & 1 \end{pmatrix}$, 矩阵 B 满足 $ABA^* = 2BA^* + E$, 则 $|B| = \underline{\quad}$

[分析]: 常见结论: $|kA_{n \times n}| = k^n |A|$; $|AB| = |A||B|$; $A^*A = AA^* = |A| \cdot E$

解: 由 $ABA^* = 2BA^* + E \xrightarrow{\text{移项}} ABA^* - 2BA^* = E$

提因子 $\Rightarrow (A - 2E)BA^* = E \xrightarrow{\text{右乘 } A} (A - 2E)BA^*A = EA = A$

$\Rightarrow 3(A - 2E)B = A \xrightarrow{\text{取行列式}} 3(A - 2E) \cdot |B| = |A| \cdot 3$

$\therefore |B| = \frac{1}{27} |A| = \frac{1}{9}$

$|A| = \begin{vmatrix} 2 & 1 & 0 \\ 1 & 2 & 0 \\ 0 & 0 & 1 \end{vmatrix} = 3$

$|A - 2E| = \begin{vmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & -1 \end{vmatrix} = 1$

2.4 逆矩阵

1. 定义: 对于一个 n 阶矩阵 A , 若存在一个 n 阶矩阵 B , 使得 $AB=E$ (或 $BA=E$),

则称 A 可逆, 且称 B 为 A 的可逆矩阵, 记为 A^{-1} , 即 $B=A^{-1}$ (且 $A=B^{-1}$)

注: ① $E^{-1}=E$; ② 若 A 可逆, 则 A 的逆阵是唯一的.

解释: 假设 B, C 均为 A 的逆阵 $\Rightarrow \begin{cases} AB=BA=E \\ AC=CA=E \end{cases}$

$$\Rightarrow B = BE = B \cdot AC = E \cdot C = C \Rightarrow B = C$$

③ 若 $ABC=E$, 则 A, B, C 均可逆, 且 $A^{-1}=BC$, $C^{-1}=AB$, $B^{-1}=CA$

解释: 由 $A^{-1}A=E \Rightarrow B \underbrace{CA}_{B^{-1}}=E \Rightarrow B^{-1}=CA$

例. 设方阵 A 满足 $A^2+A=4E$, 求 $(A-E)^{-1}$

[分析]: 抽象矩阵求逆: 凑定义法: $(A-E) \cdot \square = E$ 或 $\square \cdot (A-E) = E$

解: (法一) 由 $A^2+A=4E \Rightarrow A^2-A+2A=4E \Rightarrow A(A-E)+2A-2E+2E=4E$

$$\Rightarrow A(A-E)+2(A-E)=2E \Rightarrow (A+2E)(A-E)=2E \Rightarrow \frac{A+2E}{2} \cdot (A-E)=E \Rightarrow (A-E)^{-1} = \frac{A+2E}{2}$$

(法二): "长除法" 由 $A^2+A=4E \Rightarrow A^2+A-4E=0$

$$\begin{array}{r} A+2E \\ A-E \overline{) A^2+A-4E} \\ \underline{A^2-A} \\ 2A-4E \\ \underline{2A-2E} \\ -2E \end{array}$$

$$\therefore A^2+A-4E = (A+2E)(A-E) + (-2E) = 0$$

$$\Rightarrow (A+2E)(A-E) = 2E, \text{ 以下同法一.}$$

2. 可逆的充要条件.

(1). 若 A 可逆 $\Leftrightarrow |A| \neq 0$ (2) 若 A 可逆, $A^{-1} = \frac{1}{|A|} A^*$

解释: $\Rightarrow$ 若 A 可逆, 则 $A \cdot A^{-1} = E \Rightarrow |AA^{-1}| = |E|$

$$\Rightarrow |A| \cdot |A^{-1}| = 1 \Rightarrow |A| \neq 0$$

$\Leftarrow$ 若 $|A| \neq 0$, 由 $AA^* = |A|E$, 则 $A \cdot \frac{A^*}{|A|} = E$

故 A 可逆, 且 $A^{-1} = \frac{A^*}{|A|}$ ("伴随阵")

$A^{-1} = \frac{1}{|A|} A^*$

例. 求下列矩阵的逆阵: (1) $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$ (2) $A = \begin{pmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{pmatrix}$ 框框老师课堂

证: (1) 利用“伴随法”: $A^{-1} = \frac{1}{|A|} A^*$, 其中 $|A| = ad - bc \neq 0$, $A^* = \begin{pmatrix} A_{11} & A_{21} \\ A_{12} & A_{22} \end{pmatrix} = \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$

$$\therefore A^{-1} = \frac{1}{ad-bc} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix} \quad (\text{“两调一除”}) \quad A_{11} = (-1)^{1+1} M_{11}$$

(2). $A = \begin{pmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{pmatrix} \Rightarrow A^{-1} = \frac{1}{|A|} A^*$, 其中 $|A| \neq 0$, $A^* = \begin{pmatrix} A_{11} & A_{21} & A_{31} \\ A_{12} & A_{22} & A_{32} \\ A_{13} & A_{23} & A_{33} \end{pmatrix}$

$$\therefore A^{-1} = \frac{1}{|A|} \begin{pmatrix} A_{11} & A_{21} & A_{31} \\ A_{12} & A_{22} & A_{32} \\ A_{13} & A_{23} & A_{33} \end{pmatrix} = \frac{1}{|A|} \begin{pmatrix} M_{11} & -M_{21} & M_{31} \\ -M_{12} & M_{22} & -M_{32} \\ M_{13} & -M_{23} & M_{33} \end{pmatrix}$$

例. 设 $A = \begin{pmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{pmatrix}$, $B = \begin{pmatrix} 0 & \lambda_1 \\ \lambda_2 & 0 \end{pmatrix}$, $\lambda_1 \neq 0$, $\lambda_2 \neq 0$, 证明: $A^{-1} = \begin{pmatrix} \frac{1}{\lambda_1} & 0 \\ 0 & \frac{1}{\lambda_2} \end{pmatrix}$, $B^{-1} = \begin{pmatrix} \frac{1}{\lambda_2} & 0 \\ 0 & \frac{1}{\lambda_1} \end{pmatrix}$ 框框老师课堂

证明: (1) $A^{-1} = \frac{1}{|A|} A^* = \frac{1}{\lambda_1 \lambda_2} \begin{pmatrix} \lambda_2 & 0 \\ 0 & \lambda_1 \end{pmatrix} = \begin{pmatrix} \frac{1}{\lambda_1} & 0 \\ 0 & \frac{1}{\lambda_2} \end{pmatrix}$

(2) $B^{-1} = \frac{1}{|B|} B^* = \frac{1}{-\lambda_1 \lambda_2} \begin{pmatrix} 0 & -\lambda_1 \\ -\lambda_2 & 0 \end{pmatrix} = \begin{pmatrix} \frac{1}{\lambda_2} & 0 \\ 0 & \frac{1}{\lambda_1} \end{pmatrix}$

问: $\begin{pmatrix} \lambda_1 & 0 & 0 \\ 0 & \lambda_2 & 0 \\ 0 & 0 & \lambda_3 \end{pmatrix}^{-1} = \begin{pmatrix} \frac{1}{\lambda_1} & 0 & 0 \\ 0 & \frac{1}{\lambda_2} & 0 \\ 0 & 0 & \frac{1}{\lambda_3} \end{pmatrix}$, $\begin{pmatrix} \lambda_1 & 0 & 0 \\ 0 & \lambda_2 & 0 \\ 0 & 0 & \lambda_3 \end{pmatrix}^{-1} = \begin{pmatrix} \frac{1}{\lambda_1} & 0 & 0 \\ 0 & \frac{1}{\lambda_2} & 0 \\ 0 & 0 & \frac{1}{\lambda_3} \end{pmatrix}$, $\lambda_i \neq 0, i=1, 2, 3$

例. 设 $A = \begin{pmatrix} 1 & 2 & 3 \\ 2 & 2 & 1 \\ 3 & 4 & 3 \end{pmatrix}$, $B = \begin{pmatrix} 2 & 1 \\ 5 & 3 \end{pmatrix}$, $C = \begin{pmatrix} 1 & 3 \\ 2 & 0 \\ 3 & 1 \end{pmatrix}$. 求矩阵 X 使满足 $AXB = C$ 框框老师课堂

[分析]: 求解矩阵方程: 3种考虑: ① $A \cdot X = B$; ② $X \cdot A = B$; ③ $AXB = C$

解: 由 $AXB = C$ 且 $|A| = 2 \neq 0$, $|B| = 1 \neq 0 \Rightarrow$ 则 $X = A^{-1}CB^{-1}$

① 其中: $A^{-1} = \frac{1}{|A|} A^* = \frac{1}{2} \begin{pmatrix} A_{11} & A_{21} & A_{31} \\ A_{12} & A_{22} & A_{32} \\ A_{13} & A_{23} & A_{33} \end{pmatrix} = \frac{1}{2} \begin{pmatrix} 2 & 6 & -4 \\ -3 & -6 & 5 \\ 2 & 2 & 2 \end{pmatrix} = \begin{pmatrix} 1 & 3 & -2 \\ -\frac{3}{2} & -3 & \frac{5}{2} \\ 1 & 1 & -1 \end{pmatrix}$

② $B^{-1} = \frac{1}{|B|} B^* = \frac{1}{1} \begin{pmatrix} 3 & -1 \\ -5 & 2 \end{pmatrix} = \begin{pmatrix} 3 & -1 \\ -5 & 2 \end{pmatrix}$

$\therefore X = \begin{pmatrix} 1 & 3 & -2 \\ -\frac{3}{2} & -3 & \frac{5}{2} \\ 1 & 1 & -1 \end{pmatrix} \begin{pmatrix} 1 & 3 \\ 2 & 0 \\ 3 & 1 \end{pmatrix} \begin{pmatrix} 3 & -1 \\ -5 & 2 \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ 0 & -2 \\ 0 & 2 \end{pmatrix} \begin{pmatrix} 3 & -1 \\ -5 & 2 \end{pmatrix} = \begin{pmatrix} -2 & 1 \\ 10 & -4 \\ -10 & 4 \end{pmatrix}$

3. 可逆矩阵的性质

① 若 A 可逆 $\Rightarrow (A^{-1})^{-1} = A$, 且 $|A^{-1}| = \frac{1}{|A|}$; ② $k \neq 0$ 时, $(kA)^{-1} = \frac{1}{k} A^{-1}$

③ 若 A, B 均可逆, 则 $(AB)^{-1} = B^{-1} A^{-1}$ (类似: $(ABC)^{-1} = C^{-1} B^{-1} A^{-1}$)

④ 若 A 可逆 $\Rightarrow A^T, A^*$ 也可逆, 且 $(A^T)^{-1} = (A^{-1})^T, (A^*)^{-1} = (A^{-1})^* = \frac{1}{|A|} A$

解释④: 由 A 可逆, 则 $|A| \neq 0 \Rightarrow |A^T| = |A| \neq 0, |A^*| = |A|^{n-1} \neq 0$, 即 A^T, A^* 可逆

1°. 由 $A^T (A^{-1})^T = (A^{-1} A)^T = E^T = E \Rightarrow (A^T)^{-1} = (A^{-1})^T$

2°. 由 $A^* (A^{-1})^* = (A^{-1} A)^* = E^* = |E| \cdot E^{-1} = E \Rightarrow (A^*)^{-1} = (A^{-1})^*$

注: $(A+B)^{-1} \neq A^{-1} + B^{-1}$ 如 $A = \begin{pmatrix} 1 & 0 \\ 0 & 2 \end{pmatrix}, B = \begin{pmatrix} 3 & 0 \\ 0 & 4 \end{pmatrix} \Rightarrow (A+B)^{-1} = \begin{pmatrix} \frac{1}{4} & 0 \\ 0 & \frac{1}{6} \end{pmatrix}$
 $(A+B)^{-1} \neq A^{-1} + B^{-1}$ 而 $A^{-1} = \begin{pmatrix} 1 & 0 \\ 0 & \frac{1}{2} \end{pmatrix}, B^{-1} = \begin{pmatrix} \frac{1}{3} & 0 \\ 0 & \frac{1}{4} \end{pmatrix} \Rightarrow A^{-1} + B^{-1} = \begin{pmatrix} \frac{4}{3} & 0 \\ 0 & \frac{3}{4} \end{pmatrix}$

Q 10

例: 若 A_{nm} , 证明下列结论: (1) $A^* = |A| \cdot A^{-1}$; (2) $|A^*| = |A|^{n-1}$; (3) $(kA)^* = k^{n-1} A^*$

(4) $(AB)^* = B^* A^*$; (5) $(A^T)^* = (A^*)^T$; (6) $(A^*)^* = |A|^{n-2} A$

证明: (1) 由 $AA^* = |A| \cdot E \xrightarrow{\text{左乘 } A^{-1}} A^* = A^{-1} |A| E = |A| \cdot A^{-1} E = |A| \cdot A^{-1} \Rightarrow A^* = |A| A^{-1}$

(2) 由 (1) 得 $A^* = |A| A^{-1} \Rightarrow |A^*| = | |A| A^{-1} | = |A|^n |A^{-1}| = |A|^n \cdot \frac{1}{|A|} = |A|^{n-1}$

(3) 由 $(kA)^* = |kA| \cdot (kA)^{-1} = k^n |A| \cdot \frac{1}{k} A^{-1} = k^{n-1} |A| A^{-1} = k^{n-1} A^*$

(4) 由 $(AB)^* = |AB| \cdot (AB)^{-1} = |A| \cdot |B| \cdot B^{-1} A^{-1} = |A| A^{-1} \cdot |B| B^{-1} = A^* B^*$

(5) 由 $(A^T)^* = |A^T| \cdot (A^T)^{-1} = |A| \cdot (A^{-1})^T = (|A| A^{-1})^T = (A^*)^T$

(6) 由 $(A^*)^* = |A^*| \cdot (A^*)^{-1} = |A|^{n-1} \cdot (|A| A^{-1})^{-1} = |A|^{n-1} \cdot \frac{1}{|A|} A = |A|^{n-2} A$

Q 10

例: 设 A, B 均为 n 阶方阵, $|A| = 2, |B| = 3$, 求 $|2A^* B^{-1}|$.

解: $|2A^* B^{-1}| = 2^n |A^* B^{-1}| = 2^n |A^*| |B^{-1}|$
 $= 2^n |A|^{n-1} \cdot \frac{1}{|B|}$

$$|A^*| = |A|^{n-1}$$

Q 12

2.5 分块矩阵

例如: $A = \begin{pmatrix} 1 & 2 & 0 & 0 & 0 \\ 3 & 4 & 1 & 0 & 0 \\ 5 & 6 & -1 & 2 & 0 \\ 7 & 8 & 0 & 0 & 1 \end{pmatrix}$ 记 $A_1 = \begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$, $A_2 = \begin{pmatrix} 0 & 0 & 0 \\ 1 & 0 & 0 \end{pmatrix}$, $A_3 = \begin{pmatrix} 5 & 6 \\ 7 & 8 \end{pmatrix}$, $A_4 = \begin{pmatrix} -1 & 2 & 0 \\ 0 & 0 & 1 \end{pmatrix}$

则 $A = \begin{pmatrix} A_1 & A_2 \\ A_3 & A_4 \end{pmatrix}$, 我们称 A 为分块矩阵

(1) 分块矩阵的加法:

$$\begin{pmatrix} A_1 & A_2 \\ A_3 & A_4 \end{pmatrix} + \begin{pmatrix} B_1 & B_2 \\ B_3 & B_4 \end{pmatrix} = \begin{pmatrix} A_1+B_1 & A_2+B_2 \\ A_3+B_3 & A_4+B_4 \end{pmatrix} \quad \text{其中 } A_i \text{ 与 } B_i \text{ 为同型矩阵.}$$

(2) 分块矩阵的数量乘法

设 $A = \begin{pmatrix} A_1 & A_2 \\ A_3 & A_4 \end{pmatrix}$, k 为一个数, 则 $kA = \begin{pmatrix} kA_1 & kA_2 \\ kA_3 & kA_4 \end{pmatrix}$

(3) 分块矩阵的乘法:

$$\begin{pmatrix} A_1 & A_2 \\ A_3 & A_4 \end{pmatrix} \begin{pmatrix} B_1 & B_2 \\ B_3 & B_4 \end{pmatrix} = \begin{pmatrix} A_1B_1+A_2B_3 & A_1B_2+A_2B_4 \\ A_3B_1+A_4B_3 & A_3B_2+A_4B_4 \end{pmatrix}$$

如: $\begin{pmatrix} E & A \\ B & E \end{pmatrix} \begin{pmatrix} E & C \\ D & E \end{pmatrix} = \begin{pmatrix} E+AD & C+A \\ B+D & BC+E \end{pmatrix}$

$$C_{11} = E + AD \quad C_{12} = C + A$$

(4) 分块矩阵的转置

$$\begin{pmatrix} A & B \\ C & D \end{pmatrix}^T = \begin{pmatrix} A^T & C^T \\ B^T & D^T \end{pmatrix}$$

(5) 分块对角阵的行列式与 n 次幂.

① 设 $A = \begin{pmatrix} A_1 & 0 \\ 0 & A_2 \end{pmatrix} \Rightarrow |A| = |A_1| \cdot |A_2|$ (拉普拉斯公式)

推广: $A = \begin{pmatrix} A_1 & & \\ & A_2 & \\ & & \ddots \\ & & & A_n \end{pmatrix} \Rightarrow |A| = |A_1| \cdot |A_2| \cdots |A_n|$

② 设 $A = \begin{pmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{pmatrix} \Rightarrow A^2 = \begin{pmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{pmatrix} \begin{pmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{pmatrix} = \begin{pmatrix} \lambda_1^2 & 0 \\ 0 & \lambda_2^2 \end{pmatrix} \Rightarrow A^n = \begin{pmatrix} \lambda_1^n & 0 \\ 0 & \lambda_2^n \end{pmatrix}$

推广: $A = \begin{pmatrix} A_1 & & \\ & A_2 & \\ & & \ddots \\ & & & A_n \end{pmatrix} \Rightarrow A^n = \begin{pmatrix} A_1^n & & \\ & A_2^n & \\ & & \ddots \\ & & & A_n^n \end{pmatrix}$

(b) 四种分块矩阵的逆 (拉普拉斯法)

① 设 $A = \begin{pmatrix} A_1 & 0 \\ 0 & A_2 \end{pmatrix}$ 其中 A_1, A_2 可逆 $\Rightarrow A^{-1} = \begin{pmatrix} A_1^{-1} & 0 \\ 0 & A_2^{-1} \end{pmatrix}$

解释: 因为: $\begin{pmatrix} A_1 & 0 \\ 0 & A_2 \end{pmatrix} \begin{pmatrix} A_1^{-1} & 0 \\ 0 & A_2^{-1} \end{pmatrix} = \begin{pmatrix} E & 0 \\ 0 & E \end{pmatrix} \Rightarrow \begin{pmatrix} A_1 & 0 \\ 0 & A_2 \end{pmatrix}^{-1} = \begin{pmatrix} A_1^{-1} & 0 \\ 0 & A_2^{-1} \end{pmatrix}$

② 设 $A = \begin{pmatrix} 0 & A_1 \\ A_2 & 0 \end{pmatrix}$ 其中 A_1, A_2 可逆 $\Rightarrow A^{-1} = \begin{pmatrix} 0 & A_1^{-1} \\ A_2^{-1} & 0 \end{pmatrix}$

③ 设 A, B 均可逆, 则 $\begin{pmatrix} A & 0 \\ C & B \end{pmatrix}^{-1} = \begin{pmatrix} A^{-1} & 0 \\ -B^{-1}CA^{-1} & B^{-1} \end{pmatrix}$

解释: $\begin{pmatrix} A & 0 \\ C & B \end{pmatrix} \begin{pmatrix} A^{-1} & 0 \\ -B^{-1}CA^{-1} & B^{-1} \end{pmatrix} = \begin{pmatrix} E & 0 \\ 0 & E \end{pmatrix}$
 $\therefore \begin{pmatrix} A & 0 \\ C & B \end{pmatrix}^{-1} = \begin{pmatrix} A^{-1} & 0 \\ -B^{-1}CA^{-1} & B^{-1} \end{pmatrix}$

问: $\begin{pmatrix} A & C \\ 0 & B \end{pmatrix}^{-1} = ?$
 $\begin{pmatrix} A^{-1} & -A^{-1}CB^{-1} \\ 0 & B^{-1} \end{pmatrix}$

例. 设 $A = \begin{pmatrix} 5 & 2 & 0 & 0 \\ 2 & 1 & 0 & 0 \\ 0 & 0 & 8 & 3 \\ 0 & 0 & 5 & 2 \end{pmatrix}$ 求 $|A|, A^{-1}$

解: 记 $A = \begin{pmatrix} B & 0 \\ 0 & C \end{pmatrix}$ ①. $|A| = |B| \cdot |C| = 1 \cdot 1 = 1$

②. $A^{-1} = \begin{pmatrix} B^{-1} & 0 \\ 0 & C^{-1} \end{pmatrix}$ 其中 $B^{-1} = \frac{1}{|B|} B^* = \frac{1}{1} \begin{pmatrix} 1 & -2 \\ -2 & 5 \end{pmatrix}$, $C^{-1} = \frac{1}{|C|} C^* = \begin{pmatrix} 2 & -3 \\ -5 & 8 \end{pmatrix}$

$\therefore A^{-1} = \begin{pmatrix} 1 & -2 & 0 & 0 \\ -2 & 5 & 0 & 0 \\ 0 & 0 & 2 & -3 \\ 0 & 0 & -5 & 8 \end{pmatrix}$
